

NORTHSTAR ORBITAL LABS / COMPONENT ASSURANCE

# Radiation Test Evidence Candidate Review Package

DOCUMENT STR-24-081 / REV A

| FIELD          | REPORTED VALUE         | REVIEW NOTE                 |
|----------------|------------------------|-----------------------------|
| Manufacturer   | SYNTHETIC MANUFACTURER | Fictional parser test value |
| Orderable part | SYNTHETIC-PART-001     | Fictional parser test value |
| Package / lot  | CFP / not stated       | Identity remains incomplete |
| Mission use    | LEO avionics candidate | No approved mission linkage |

## Executive review note

This package consolidates excerpts supplied for a TID screening discussion. It is intentionally incomplete: the approved bill of materials, die traceability, lot acceptance record, and mission-specific applicability statement are absent.

### REVIEW BOUNDARY

No suitability decision. No approved target comparison. Destructive SEE coverage is unresolved.

NOT FOR DECISION

# 1. Test narrative and extracted conditions

## LEFT COLUMN / SOURCE NARRATIVE

The source memo describes room-temperature irradiation of biased devices. Dose points were recorded by the test operator, but the facility certificate and dosimetry chain are not included in this package.

A functional check was reportedly performed after each exposure. The narrative mentions SEU behavior only as a follow-up topic; no event cross-section table or beam species record is attached.

### Operator note (transcribed)

"Electrical parameters remained within the synthetic acceptance band. This sentence is training content and must not be interpreted as a published result."

## RIGHT COLUMN / SYNTHETIC PLOT

### Normalized response vs. dose step

Figure 1. Layout-realistic training graphic. Values are deliberately non-authoritative and are excluded from SPECTRA decision input.

### MISSING ATTACHMENTS

- A. facility certificate
- B. raw measurement file
- C. approved test plan
- D. mission applicability review

## 2. Single-event effects coverage matrix

The matrix below preserves the distinction between a term appearing in a document and evidence that actually closes a coverage requirement.

| EVENT         | DOCUMENT STATEMENT                    | ATTACHMENT | REVIEW STATE     |
|---------------|---------------------------------------|------------|------------------|
| SEL           | Referenced in planning notes          | None       | UNRESOLVED       |
| SEB           | Not tested; destructive setup absent  | None       | GAP              |
| SEGR          | Not tested; gate-stress record absent | None       | GAP              |
| Cross-section | No fluence-normalized result          | None       | DATA UNAVAILABLE |

### Reviewer interpretation

The appearance of an event acronym is a locator candidate, not proof of a test result. SEU information cannot replace destructive-event coverage. The package therefore remains unsuitable for an assurance decision.

FAIL-CLOSED RESULT

HOLD

Coverage gaps remain explicit.

# Appendix A. Evidence locator index

| LOCATOR         | PAGE | WHAT A REVIEWER CAN CONFIRM                     |
|-----------------|------|-------------------------------------------------|
| supplier-block  | 1    | Manufacturer string and candidate part string   |
| tid-narrative   | 1    | TID acronym occurs in an incomplete review note |
| seu-follow-up   | 2    | SEU acronym occurs without a result table       |
| destructive-see | 3    | SEL / SEB / SEGR appear as unresolved coverage  |

## Document control and limitations

- 01 This file is generated solely to test document parsing and evidence gating.
- 02 Northstar Orbital Labs is fictional; no affiliation or certification is claimed.
- 03 All plotted values and conditions are synthetic and must not enter engineering calculations.
- 04 The expected extraction targets are published in a separate machine-readable ground-truth file.
